

A VisiData Cheat Sheet	
Version	VisiData v1.5.2
Updated	2019-07-07
More info	visidata.org github.com/ondata/guidaVisiData jsvine.github.io/intro-to-visidata

Getting out of trouble

Ctrl-c	Abort the current command
Ctrl-q	Force-quit VisiData entirely
q	Quit the current VisiData "sheet"
Ctrl-h	Display the "Quick Reference Guide"
z + Ctrl-h	Display list of commands available on the current sheet

Input/output

o + <i>filename</i>	Open a file
Ctrl-s + <i>filename</i>	Save current sheet to <i>filename</i>
g + Ctrl-s + <i>filename</i>	Save all sheets to <i>filename</i>
gY	Copy sheet (or selected rows) to clipboard
gzY	Copy column (or selected rows for column) to clipboard

Metasheets

S	Sheets Sheet
gS	Sheets Graveyard
C	Columns Sheet
O	Gobal options sheet
zO	This-sheet options sheet

Move cursor ...

gj	to the last row
gk	to the first row
gh	to the leftmost column
gl	to the rightmost column
Ctrl-F	one page down (forward)
Ctrl-B	one page up (backward)

Moving via search

/ + <i>regex</i>	Search forward in <i>current</i> column
? + <i>regex</i>	Search backward in <i>current</i> column
g/ + <i>regex</i>	Search forward in <i>all</i> columns
g? + <i>regex</i>	Search backward in <i>all</i> columns
n	Move to next matching row
N	Move to previous matching row

Basic row selection

s	Select the current row
u	Unselect the current row
t	Toggle the current row between selected/unselected
gs	Select all rows
gu	Unselect all rows
gt	Toggle all rows between selected/unselected

Advanced row selection

 + <i>regex</i>	Select all rows where <i>regex</i> matches the current column
\ + <i>regex</i>	Unselect all rows where <i>regex</i> matches the current column
gl + <i>regex</i>	Select all rows where <i>regex</i> matches any column
g\ + <i>regex</i>	Unselect all rows where <i>regex</i> matches any column
,	Select all rows where the current column matches the current cell
g,	Select all rows where any column matches the current cell
z + <i>expr</i>	Select all rows where <i>expr</i> evaluates to <code>True</code>
z\ + <i>expr</i>	Unselect all rows where <i>expr</i> evaluates to <code>True</code>

Shifting rows / columns

J	Move row up
K	Move row down
H	Move column left
L	Move column right

Setting column types

#	Integer
%	Float
\$	Currency
@	Date
~	Text

Renaming columns

^	Rename current column
g^	Set names of all <i>unnamed</i> columns to the values in the current or selected row(s)
gz^	Set names of all <i>visible</i> columns to the values in the current or selected row(s)

Resizing columns

_	Adjust the width of current column to fit text in all visible rows
g_	Adjust the width of all columns to fit text in all visible rows
z_ + <i>n</i>	Set the current column's width to <i>n</i> characters
-	Hide the current column by setting its width to 0
gv	Unhide all columns
z-	Shrink the current column's width in half

Sort rows ...

[in ascending order of <i>current column</i>
]	in descending order of <i>current column</i>
g[in ascending order of <i>key columns</i>
g]	in descending order of <i>key columns</i>

Filtering

"	Create new sheet of selected rows
gz"	Create new sheet with "deep copy" of selected rows
R + <i>n</i>	Create new sheet containing <i>n</i> randomly chosen rows

Summarizing data

F	Create frequency table of <i>current column</i>
gF	Create frequency table of <i>key columns</i>
+ + <i>aggregator</i>	Add aggregator to column
z+ + <i>aggregator</i>	Calculate one-time aggregation of column
I	Create a "Describe Sheet," with summary stats for each column

Creating new columns

= + <i>expr</i>	Create a new column from a Python <i>expr</i> evaluated against each row
: + <i>regex</i>	Create new column(s) by splitting current column on <i>regex</i>
; + <i>regex</i>	Create new column(s) by extracting <i>regex</i> groups from current column
'	Create "frozen" copy of current column, with all cells evaluated

Reshaping data

W	Create pivot table sheet, with key column(s) as rows and current column as values
M	Create "melted" sheet, with key columns as non-melted values
T	Create a transposed sheet, where columns become rows and v.v.

Editing cells

e	Begin editing current cell
Enter	Finish editing
Ctrl-c	Cancel editing
Ctrl-a	Move to beginning of cell
Ctrl-e	Move to end of cell
Ctrl-k	Clear contents from cursor's position to end of line

Misc.

Ctrl-^	Toggle between current and previous sheet
!	Make current column a "key" column
Space	Open long-name command prompt
